## Facilis Technology Announces Support for Mac OS X Lion

HUDSON, MA (August 29, 2011) – Facilis Technology, a leader in advanced shared storage solutions for post-production and content creation, today announced that it has qualified its TerraBlock line of shared storage solutions, versions 5.0 and above, for Mac OS X Lion.

“Integrating support for OS X Lion into TerraBlock is an extension of our commitment to supporting the latest and most advanced platforms for creative professionals,” said Shane Rodbourn, SVP & general manager, Facilis. “Customers who use or purchase TerraBlock 5.0 and above can now experience the same high performance and capacity of TerraBlock with the highly anticipated OS X Lion release.”

TerraBlock, Facilis’ high-capacity, shared storage system, supports Fibre channel and Ethernet, volume and file-level control, and multiple platforms. It outperforms the competition and provides a lower total cost of ownership (TCO) than that of traditional SAN infrastructure.

While Facilis TerraBlock, versions 5.0 and above are qualified for OS X Lion, not all third party creative applications that may be running on TerraBlock support the release. Facilis advises users to contact application providers to verify support before upgrading.

### **About Facilis Technology**

Facilis Technology, Inc. was founded in 2003 to bring advanced shared storage to television and film post production at a reasonable price. The company designs and builds high-capacity, turnkey solutions that are open, flexible and scalable; enabling content creators to collaborate and work more efficiently.
